

DRYLOK®

a better solution for masonry dry-In

UGL® UNITED
GILSONITE
LABORATORIES

COMPLETE PROJECTS FASTER

“Dry-In” means that the building shell has been completed sufficiently to keep out wind, rain, or the weather in general, thus assuring that weather-sensitive materials or work can begin indoors without those materials suffering weather damage.

- Economical choice for negative side waterproofing
- Resists 98 mph wind-driven rain
- For masonry and porous cementitious surfaces
- Very low permeability

SAVE TIME

For any building construction project, the responsible contractor will specify special temporary building protective measures to achieve “dry-in” status to permit interior work to begin. Solutions for moisture-retaining materials are limited. DRYLOK® Masonry Waterproofing is a solution that can remain on the structure, and interior building materials can be applied over the waterproof barrier.

Our Advantages

- Cost effective
- Resists wind-driven rain
- Water base acrylic Latex
- Easy application / easy cleanup
- Nationwide rep support
- Complete project faster
- No special application tools
- Distributed nationwide
